

**Cut away schematic diagram of manufactured gully with pumped diversion to irrigation**

Greywater can be pumped from the surge tank to the irrigation system. If necessary, the surge tank may be partially or wholly below ground level.

Commercially manufactured units usually comprise a plastic gully and grating, submersible pump, and an override switch which diverts all the greywater to the sewer or on-site treatment if necessary.

Water unsuitable for irrigation such as kitchen wastewater, discharges to the sewer or on-site treatment plant.
